

Log-Log Scaling Law of Terminal Metrics vs ϵ_g

Osc slope ≈ 0.67 , d_{slow} slope ≈ 0.98 (first-order=1, gap from $\sigma(\Delta)$ saturation)

Monotone Scaling Preserved:

$\epsilon_g \uparrow 10^2 \Rightarrow d_{\text{slow}} \uparrow 91.0x$

Sub-first-order reflects $\sigma(\Delta)$ softmax higher-order residual
